Delete the current Abstract and replace therewith the attached substitute Abstract.

[[In a]] A user notification system used for a home delivery locker which a home delivery locker and a managing center for managing the home delivery locker are connected through a communication line, and information indicating that the home delivery locker has a parcel is received by the managing center, ~~the system is characterized in that, based.~~ Based upon information of the ~~receiver~~ recipient contained in the information, the managing center or the home delivery locker automatically delivers the parcel delivery information to the ~~receiver~~ recipient through a communication [[means]] apparatus such as telephone (including mobile telephone), facsimile and electronic mail. In the case of a conventional pick-up process of a parcel, it is not possible to confirm whether or not any parcel has arrived, until the ~~receiver~~ recipient has come home and see a notice inside the mail post; therefore, the resulting problem is that, in the case of any urgent parcel, the ~~receiver~~ recipient has to go to the mail box many times to see whether there is any notice therein. The present system makes it possible to solve such a problem.
